

Exploratory Testing & Security Assessment

1. UI & E2E (API) Bugs / Inconsistencies.

- The **comment and UpVote buttons** don't have any description (toolbox) while hovering on it.
- Sign up to vote but even without signing up the vote count increased.
- Duplicate rank numbers in the same list. In "Last Week's Top Products," the ranking goes 1, 2, 2, 4.
- Product name / URL slug mismatch. The product displayed as "Xirp," described as "The agentic development environment built by Spotify," links to </products/spotify> — the slug doesn't match the displayed name at all. Similarly with other products as well.
- After login through Gmail - Headline was the mandatory field - it was not mentioned anywhere or star sign.
- Flakiness with the UpVote count after browser refresh.
- Comment count not increasing after dropping off a couple of comments.

2. Security Assessment : GraphQL is locked behind a bearer token
